

Apollon

Apollon industrial productions group

Producer of types of electric,gaseous , over stove & coal design samovars

First to have the three licenses of ISO 10004_10002_9001 for manipulating quality & costumer's satisfaction in samovar production

Non burning without water ,220V AC,

1000W,Net Capacity:5 litters

Patent number 47034

48495

Gaseous samovar instruction

Apollon industrial productions group(YousefZade)is the first to have the three licenses of ISO ISO10004(2010)_ISO10002(2004)_ISO9001(2008) for manipulating quality & costumer's satisfaction in samovar production. (electric,gaseous , over stove)

The frame work of Apollon'selectric,gaseous& over stove samovars(pluto model) is completely single piece & is formed by hydraulic press.Az a result,the lifetime will be longer.

Inside any of Apollon'selectric,gaseous& over stove samovars,no Tin or Plumbum is used & the water dam washers inside the samovars are white silicon brass (hygienic).So any kind of hazards is prevented.

(Important remark: The correct way to turn the Apollon's light on in Thermocouple & Pluto model)

* just like the previous * release the volume * keep it on the candlestick mode * press toward inside
order decrease it and increase it & then use a lighter

1. Put the red part of the volume in the off mode, then press it as much as it is possible toward inside and turn it to the candlestick and fix it.
2. Put the volume on the candlestick mode and after using a lighter wait for 3 to 5 seconds. Then release the volume to come up and get out of the stop mode.
3. Without pressing the faucet toward inside, turn it either to intense mode or slight mode (according to your decision).

Descriptions:

-while getting out of the intense mode to candlestick, you must press the volume toward inside in order to get it out of stop mode.

- if the light of the candle stick becomes less or off,with the adjusting lever which is upside the candlestick adjust it.(the candlesticks light mustn't be more than 1cm)
- if the light does not turn on for any reason,do the previous orders again.
- if the set of the samovar has a problem for any reason and do not turn on,without any effort to fix it,call the services and have some advice from the advisor.

Thanks for your choice

Apollon industrial group(YousefZade)

Electric samovar

Apollon's completely electric samovar has an adjustable cathode system that if the samovar is out of water, the secondary thermostat empties element's electricity and the light of the samovar will remain on.

In order to adjust samovar's volume in the automatic point, first of all you must turn the volume to the boil point which is carved on the samovar; after 5 minutes of the water's boiling, gradually turn the volume back till the light goes off. Now your samovar is in the automatic. Pay attention that this point is changable based on the water's amount.

This means that how much more the water is, the automatic point is closer to the boiling point and how much less the water is, the automatic point is farer from the boiling point. It is necessary to say that the precision of the first thermostat is adjusted in a way that makes your samovar automatic in less than 10 minutes.

Also in this model the overlay of the element is steel that in comparison with the previous types is more resistant and the risk of the element blowing because of becoming hot or cold is prevented. the framework of Apollon samovar has a longer lifetime as it is completely one piece.

All the parts that are in touch have electricity and thermal nonconductors. In the new models the handhold is bigger and is designed proportional to the product's framework and as the result, the danger possibility is decreased to a significant extent. Also because of changing the energy managing system from hydraulic into adjustable cathode, the guarantee of electric samovars that have adjustable cathode system, is increased from 1 year to 2.

Important remark:

In order to connect samovar, don't use a trio-wall plug. Before using ,once boil the water inside the samovar and then open the faucet in order to let the boiles water get out through the faucet. For washing the samovar do not use string,scrubspong,knife or any other kinds of sharp material.

For washing use acetic acid or samovar descator .If you heard the element's sound in the first few days ,don't worry because this is the result of element's enormous power and by regular usage and by placing some water sediment on the element,the sound decreases.

Features:Alternative 220 volts;1000 watts;5 lit capacity.

Appolon samovar's written warranty

Clinet's name..... Phone number.....

Address.....

Samovar type..... Store's name.....

Serial number.....Saledate.....

Attention:without stamp and signiture,the seller lacks credit.

One year warranty and 10 years service

Apollon

Dear user

As the presented product is made from the best material,so some safty tips are mentioned here:

- 1.always use a samovar having the standard sign
- 2.the consumable power limitation of the product you have is about 1000watts.the electricity usage of such products each time is about 12 kilo watts.(this amount is based on your using pattern and utilization of the product that is different in each family).
- 3.the samovar you have has several laboratory degrees of national standard organization of Iran and has passing degrees fom several tests;so you should remember that electric objects especially such products that work at the same time with electricity and water must be away from kids or those with mental problems.
- 4.abstain from installing or using samovar on slope surfaces(with more than slope of 15).

5. pay attention that samovar has always water, if there is no water and is dry, first of all turn it off and put the door off and let it get cool with the inset of the air, then after 15 minets tend to pour water inside it.

6. after samovar's water boiled, always adjust it on the automatic mode and abstain from letting the samovar be on continuously.

7. in order to clean the samovar, never use sharp or cutting things or washing material like string. this act harms the protective layer inside the samovar and destroys it. for this action you can use cleaning liquid or powders available in the stores.

8. any damage or objection caused because of wrong usage or intentional damage to the samovar; results in revocation of product's warranty.
